Subject: Bayou Bridge Pipeline Project (MVN-2015-02295-WII) - Response to public comments

James,

Please find attached the draft responses to the second round of public comments received from January 12, 2017 to January 31, 2017 for the Bayou Bridge Pipeline Project (MVN-2015-02295-WII). As you are aware, there were a number of form letters that were received during the second comment period that were the exact same as the form letters received during the initial public comment period. Therefore, the last row of the response matrix references the form letter responses provided in the initial set of draft responses to public comments that were submitted to you on January 6, 2017. For your reference, I have attached an updated version of the initial response matrix to this email as well. Please let us know if you have any questions or need any additional information.

Thanks,

Marshall Olson Environmental Project Manager

EPA Comments		•		
1-1	Proposed locations for HDD indicated on the project plans include the use of a 30-foot wide right-of-way between entry and exit of the HDD. The use of HDD for pipeline installation should allow for complete avoidance of waters of the U.S. in the areas in which it is implemented. Therefore, the EPA does not believe the applicant has minimized and avoided wetlands and other waters of the U.S. to the maximum extent practicable. The applicant should eliminate the cleared right-of-way and associated impacts to aquatic habitat in HDD areas.	Maintenances of 30-foot corridor between HDD entry/exit points	BBP will not clear forested wetlands between HDD en facilitate construction of the proposed Project. In cert between HDD entry and exit locations to allow the of from barges to the construction ROW. Upon complet between the HDD entry and exit locations to pre-cons revegetate naturally. Therefore, there will be no perm and exit locations, and mitigation is proposed for the t	
1-2	Hydrologic connectivity should be maintained in wetland areas by installing adequately- spaced and appropriately-sized culverts through any access roads constructed in waters of the U.S.	Access roads impacting wetlands	All access roads that are constructed by BBP above pulled. U.S. will be properly bridged or culverted to maintain	
1-3	Best management practices (BMPs) such as the use of sediment/erosion control structures should be implemented throughout construction to reduce the flow of nonpoint source pollution into adjacent wetlands and waters of the U.S.	Erosion	In compliance with the CWA, including Section 402, measures as appropriate to avoid and minimize impac proper use of silt fences, straw bales, or other Enviror runoff control best management practices. These mea throughout construction as necessary.	
1-4	The EPA requests to review the final compensatory mitigation plan, including the mitigation ratios that are used and the mitigation banks at which credits are purchased, during this initial year of LRAM implementation. Mitigation should be performed for all direct, secondary, and temporary/conversion impacts associated with the proposed project. EPA recommends the applicant mitigate by purchasing in-kind credits from multiple mitigation banks (i.e. banks located in each of the impacted 8-digit HUCs, if appropriate credits are available).	Mitigation	In accordance with 33 CFR 332.3, BBP proposes to p mitigation banks to offset unavoidable impacts to wat District Regulatory Branch released the interim versio (LRAM) for use in calculating compensatory mitigati activities permitted under Section 404 of the Clean wa 1899 via a Special Public Notice on February 29, 201 propose appropriate mitigation requirements for the P

Draft Responses to Comments Received during the Initial Public Comment Period (October 3, 2016 – November 2, 2016			
Commenter / Comment ID	Comment	Issue	Draft USACE Response
1-5	The EPA recommends that if any non-forested wetlands are temporarily impacted by the construction area and mitigation is not proposed for these areas, the applicant should be required to monitor these wetlands for five years or until they have been completely restored and revegetated to pre-impact conditions, and submit reports to the USACE on an annual basis. If full restoration of these wetlands is not achieved, additional mitigation and/or adaptive management will be required.	Wetland monitoring	Temporary impacts to non-forested wetlands do not v accomplished by restoring wetlands to pre-construction BBP has also proposed to utilize top-soil segregation existing seed bank to facilitate natural revegetation. ' restoration measure throughout the industry.
LDWF Commen	nts		
2-1	It is requested that all final mitigation options provided for this project be made available for agency review prior to the issuance of a USACE permit. Additionally, this project may impact habitats that historically supported coastal prairie or longleaf pine savannah habitat. It is the opinion of LDWF that the applicant's mitigation options should include coastal prairie and longleaf pine savannah mitigation options.	Mitigation	In accordance with 33 CFR 332.3, BBP proposes to p mitigation banks to offset unavoidable impacts to wa LRAM to determine the appropriate mitigation require and/or pine-savannah mitigation credits as required b complete all compensatory mitigation requirements a authorization prior to beginning work in jurisdictiona
2-2	The applicant proposes to restore all temporarily impacted wetlands to pre-project conditions without mitigating for those temporary impacts. While LDWF is not opposed to this when those impacts occur within emergent or scrub-shrub habitats, LDWF recommends the allowance of a one year growing season prior to assessing permanent impacts to vegetated wetlands in these areas. Should unanticipated permanent impacts be evident following that one year growing season, the applicant shall provide adequate and appropriate mitigation for those impacts.	Wetland monitoring	Compensatory mitigation is not a requirement for ten impacted areas would be restored to pre-construction the Application Cover Letter, pg 14-16; the permit wa
2-3	The applicant proposes to maintain a 30-foot right-of-way between directional drill entry and exit points. LDWF does not support such actions within forested wetlands as they provide valuable ecological services such as water quality improvement, natural resource production, provision of wildlife habitat, airborne pollution filtration, atmospheric carbon dioxide removal, floodwater retention and stormwater runoff reduction. To avoid the loss of this valuable resource, LDWF strongly maintains that there be no clearing of forested wetlands between directional drill entry and exit sites.	Maintenances of 30-foot corridor between HDD entry/exit points	BBP will not clear forested wetlands between HDD effacilitate construction of the proposed Project. In cerr between HDD entry and exit locations to allow the offrom barges to the construction ROW. Upon comple between the HDD entry and exit locations to pre-constructed naturally. There will be no permanently m locations, and mitigation is proposed for the temporate
2-4	In an effort to reduce permanent impacts, LDWF recommends that permanent pipeline ROWs not exceed 30' in width within wetlands where directional drilling is not proposed.	Permanently maintained corridor in wetlands	BBP has proposed a 30-foot-wide permanently maint these resources.

Draft Responses to Comments Received during the Initial Public Comment Period (October 3, 2016 – November 2, 2016)			
Commenter / Comment ID	Comment	Issue	Draft USACE Response
2-5	Our database indicates the presence of bird nesting colonies within one mile of this proposed project. Be aware that entry into or disturbance of active breeding colonies is prohibited by LDWF. In addition, LDWF prohibits work within a certain radius of an active nesting colony. If work for the proposed project will commence during the nesting season, conduct a field visit to the worksite to look for evidence of nesting colonies. This field visit should take place no more than two weeks before the project begins. If no nesting colonies are found within 400 meters (700 meters for brown pelicans) of the proposed project, no further consultation with LDWF will be necessary. If active nesting colonies are found within the previously stated distances of the proposed project, further consultation with LDWF will be required. In addition, colonies should be surveyed by a qualified biologist to document species present and the extent of the colonies. Provide LDWF with a survey report which is to include: qualifications of survey personnel, methodology, species present and abundance, along with habitat, photographs and maps of the site. To minimize disturbance to colonial nesting birds, the following restrictions on activity should be observed: -For colonies containing nesting wading birds, all project activity occurring with 300 meters of an active nesting colony should be restricted to the non-nesting season (9/1-2/15) -For colonies containing nesting gulls, terns and/or black skimmers, all project activity occurring within 400 meters (700 meters for brown pelicans) of an active nesting colony should be restricted to the non-nesting colony should b	Bird rookeries	BBP conducted an aerial survey of the Project route in rookeries were identified during the survey. As docun May 2016, the Project will have no direct impacts on t are located within 1,000 feet of the proposed Project. season (February 15th to August 1st), BBP will condu- weeks prior to the start of construction to determine if survey, BBP will provide an updated survey report tha Furthermore, BBP will attempt to restrict construction recommended for any active wading bird rookeries to practicable. BBP may move construction equipment the will occur in these areas. This will minimize the Proje restriction of construction is not feasible within 400 m further consult with LDWF and USFWS as necessary.
2-6	If construction is to be performed during the denning season, further consultation with this office will be necessary. We strongly urge workers and contractors to avoid bears, particularly if work is to be conducted during the non-denning season (April - December). Employees should be cautioned to not leave food or garbage in the field, as bears can become attracted and accustomed to human food easily. In addition, we recommend the use of bear proof garbage containers on site.	LA Black Bears	It is anticipated that construction will occur primarily of May). Furthermore, BBP has designed the Project to a identified within the Project area. During construction avoid direct contact with black bears should one be ob that all employees maintain a clean work environment accustomed to human food.
2-7	The applicant shall implement adequate erosion/sediment control measures to insure that no fill material or other activity related debris are allowed to enter into adjacent wetlands. Establishing long-term stands of grass on exposed soil surfaces, and installation of erosion and sediment control blankets, silt fences, and/or straw bale barriers are conceivable control measures. These measures should be implemented immediately upon placement of fill material and maintained until all loose soils have been stabilized.	Erosion	In compliance with the CWA, including Section 402, I measures as appropriate to avoid and minimize impact proper use of silt fences, straw bales, or other Environ runoff control best management practices. These meas warranted and remain in place as necessary for compli

2-8	One 24" culvert shall be installed approximately every 250' should access roads be constructed through wetlands. Priority for the placement of those culverts should be given to natural low areas and drainages. Those culverts shall be maintained to ensure that the existing flow of surface water is uncompromised.	Access roads impacting wetlands	BBP will install and maintain appropriately sized cul- that the existing flow of surface water is uncompromi	
LDNR – Atchaf	alaya Basin Program Comments			
3-1	We request that the pipeline be installed at a depth at or below that of the adjacent natural swamp. This would require approximately 10 feet of cover, with the minimum required cover varying along the ROW according to local conditions. We recommend coordination with the ABP, St. Martin Parish, and the USACE Buffalo Cove project manager to ensure that the proposed pipeline does not interfere with restoration plans in the Beau Bayou, East Grand Lake, and Buffalo Cove water management units. USACE has authority to require that the pipeline be lowered in the event that it impedes hydrologic restoration activities. We suggest that it would be appropriate to install the pipeline at the correct depth at the outset to avoid having to re-disturb wetlands to lower the pipeline in a year or two.	Position/depth of Pipe	BBP proposes to install the pipeline 4 feet below natu with LDNR and local organizations dedicated to resto with restoration plans. The Project will be installed in basin or prohibit any ongoing or future hydrology res

4-19	The Corps must deny this permit because Bayou Bridge Pipeline, LLC has failed to propose an appropriate compensatory mitigation option. The Corps regulations, at 40 C.F.R. § 230.93(a)(1), explain that "[p]ermit applicants are responsible for proposing an appropriate compensatory mitigation option to offset unavoidable impacts." Id. Bayou Bridge Pipeline, LLC's public notice only vaguely mentions its plans to use a mitigation bank to offset any unavoidable wetland functions caused by the project implementation but fails to provide details for this mitigation option. The Corps must ensure that adequate mitigation plan information is included in the public notice "to enable the public to provide meaningful comment on the proposed mitigation," providing exception only for data which is "confidential for business purposes." 40 C.F.R. § 230.94(b). For wetland compensatory mitigation projects, a permittee must submit a mitigation plan that includes site selection criteria, baseline information for impact and compensation sites, ecological performance standards, and monitoring requirements, among other requirements. 33 C.F.R. § 322.4(c)(2)-(14). Because "permit applicants are responsible for proposing an appropriate compensatory mitigation option to offset unavoidable impacts," putting off the mitigation proposal renders the application incomplete so it must be denied. 40 C.F.R. § 230.93(a)(1). The information provided in the permit application on impacts and mitigation is wildly insufficient to allow for meaningful public comments, particularly in regard to impact on wetlands and bottomland hardwoods.	Wetland mitigation	BBP has fulfilled the requirements for proposing apprimitigation plan for the district engineer to review in a who intend to fulfill their compensatory mitigation of banks or in lieu fee programs, their mitigation plans m [Baseline Information] and (c)(6) [Determination of C mitigation bank or in-lieu fee program to be used." T Cover Letter, pg 21-24 and Attachment 11, Interim L issued until the applicable agencies have established a mitigation requirements.
4-20	Rather than paying into a mitigation bank, Bayou Bridge Pipeline, LLC should focus on preserving the unique and valuable areas in the Basin. Bringing the right-of-way back into compliance by removing the spoil banks while their equipment is on site could be a great way to mitigate inside the Atchafalaya Basin and could restore the hydrology for thousands of acres of wetlands.	Wetland mitigation	Compensatory mitigation requirements will follow th CFR § 322.3(b)(1)-(6). Accordingly, all compensator utilizing the USACE interim LRAM.
4-21	The Corps' regulations state that "compensatory mitigation requirements must be commensurate with the amount and type of impact that is associated with a particular DA permit." 40 C.F.R. §230.93. Because the effects of this pipeline will be on sensitive and valuable wetland areas, a 1:1 mitigation ratio would not commensurate with the type of impact that would result from the pipeline installation.	Wetland mitigation	BBP has proposed mitigation utilizing the interim LR required for to offset impacts associated with the Proj Corps of Engineers, New Orleans District Regulatory use in calculating compensatory mitigation requirement permitted under Section 404 of the Clean water Act a a Special Public Notice on February 29, 2016.
4-22	To assure that minimization and mitigation in the same watershed and for the correct type of wetlands are occurring, we request that, at a minimum, mitigation banks and the avoidance and minimization statement used are included in the permit application.	Wetland mitigation	BBP's statement explaining how impacts to waters of found in the Application Cover Letter, pg 17-21. 4-29	The Corps' ability to enforce this permit is limited, due to the regulatory Department of the New Orleans District of the Corps of Engineers lack of a boat and consequent inability to access water and ensure compliance. Since there is no road access to most of the Atchafalaya Basin, enforcement of the permit by the Corps would be impossible. By issuing permits that cannot be enforced, the New Orleans District is failing to respect federal law.	USACE doesn't have a boat	The New Orleans District of the USACE has adequa
4-30	Bayou Bridge Pipeline, LLC's permit application should be denied because the proposed right-of-way is currently in violation of state and federal law and is causing irreparable harm to the Basin. Currently, part of the proposed right-of-way from Bayou Bridge Pipeline, LLC houses other pipelines – including pipelines that were installed in a way that caused a ruinous disruption to the natural water flow in the Basin. An impermeable spoil bank stretches along the right-of-way, acting as a dam and thwarting the natural water flow, which would otherwise run from north-to south. The consequence of the spoil bank's obstruction is especially detrimental because the water is slow-moving and laden with sediment. Impeding the flow causes the sediment to settle and creates unnatural blockages that destroy the wetland nature of the Basin. Not only do these blockages unnaturally change the fundamental nature of the Basin, but they also hamper navigational, commercial, and recreational activities like fishing. Restoring the water flow through the spoil bank to a north-to-south direction is thus crucial to maintaining the richness of the Basin and its use for aesthetic and recreational activities.	Unlawful & environmental impacts	Collocation of linear utilities is typically a preferred conditions in the basin from previous projects constr The proposed pipeline would be constructed such tha standards. Construction methods to be utilized are d including natural water flows in the basin, navigation project prohibit any ongoing or future hydrology rest
USFWS Comm	ents		
5-1	Due to the importance of the project area as nesting habitat for bird species of conservation concern, the Service recommends that the project be constructed in a manner that would minimize bird impacts. The Migratory Bird Treaty Act prohibits the taking, killing, possession, transportation, and importation of migratory birds, their eggs, parts, and nests, except when specifically authorized by the U.S. Department of the Interior. While the Act has no provision for allowing unauthorized take, the Service realizes that some birds may be harmed or killed as a result of project-related activities even when reasonable measures to protect birds are implemented. The Service's Office of Law Enforcement (LE) carries out its mission to protect migratory birds through investigations and enforcement, as well as by fostering relationships with individuals, companies, and industries that have taken effective steps to minimize their impacts on migratory birds, and by encouraging others to enact such programs. As such, LE focuses its resources on investigating and prosecuting individuals and entities that take migratory birds without regard for their actions or without effort to implement Service recommendations or conservation measures. In this case, we recommend that no habitat alteration work within mature forested areas be performed during the nesting period (March 1 to July 31).	Migratory birds	BBP has minimized impacts to forested areas along to mature forested areas during the nesting period.

5-5	The applicant proposes to clear and maintain a 30-foot right-of-way between directional drill entry and exit points. The Service does not support such actions within forested wetlands due to their high ecological value. Furthermore, authorization of this project component could be precedent setting thereby leading to cumulative impacts to jurisdictional forested wetlands from such actions in the future. Therefore, to avoid current and future forested wetland loss from this potentially precedent-setting proposal, the Service strongly opposes the clearing of forested wetlands between directional drill entry and exit areas.	Clearing between HDD Entry/Exit	BBP will not clear forested wetlands between HDD of facilitate construction of the proposed Project. In cer- between HDD entry and exit locations to allow the o from barges to the construction ROW. Upon comple- between the HDD entry and exit locations to pre-con revegetate naturally. Therefore, there will be no per- and exist locations.	
5-6	The Service does concur with the applicant's proposed use of a 75-foot temporary construction right-of-way within wetlands where directional drilling is not proposed. However, in an effort to reduce permanent wetland impacts, the Service recommends that permanent pipeline right-of-ways not exceed 30-feet in width within those non-directional-drill wetland areas.	Permanent Easement width in non-HDD wetlands	BBP cannot feasibly install the pipeline in less than a proposed. BBP will restrict the width of the permane feet to minimize impacts to these resources.	
5-7	The applicant proposes to restore all temporarily impacted jurisdictional wetlands to pre- project conditions without mitigating for those temporary impacts. While the Service is not opposed to this when those impacts occur within emergent or scrub-shrub habitats, the Service recommends the allowance of a one-year growing season prior to assessing permanent impacts to those vegetated wetlands areas. Should unanticipated permanent impacts be evident following that one-year growing season, the applicant should provide adequate and appropriate mitigation for those jurisdictional wetland impacts.	Mitigation	Bayou Bridge has proposed mitigation for all tempor committed to successful restoration of all temporarily make necessary corrections to grade, hydrology, and	
5-8	The applicant proposes to mitigate for impacts to jurisdictional wetland resources through the purchase of in-basin/in-kind mitigation credits from Corps of Engineers-approved mitigation banks. While the Service tentatively supports this concept, the proposed project may impact habitats that were historically coastal prairie or longleaf pine savannah wetlands. If those historic wetland habitats were present within the proposed project area, the Service recommends including them as mitigation options	Mitigation	BBP proposes to compensate for both the permanent purchase of mitigation credits from USACE approve LRAM to determine the appropriate mitigation requi and/or pine-savannah mitigation credits as required b compensatory mitigation plan will be approved by th

8-3	In your permit application, you presently propose to clear and maintain a 30-foot right-of- way between directional drill entry and exit points. At this time, this office along with multiple other resource agencies have not and presently do not support such actions within forested wetlands, due to their high ecological value and based on a likely viable opportunity to avoid and minimize impacts to aquatic resources. Furthermore, authorization of this component would be considered precedent setting and conflict with other previous permit decisions, thereby leading to cumulative impacts to jurisdictional forested wetlands. Based on past knowledge and experience with other similar pipeline projects, it is our understanding that maintained forested vegetation over Horizontal Directional Drill areas is typically a viable and conceivable option. Therefore, at this time we recommend that you modify your permit application and drawings to reflect the absence of forested wetlands to cleared between directional drill entry and exit areas, unless you can provide justifications why this is not a practicable alternative.	Maintenances of 30-foot corridor between HDD entry/exit points	BBP will not clear forested wetlands between HDD er facilitate construction of the proposed Project. Commenter / Comment ID	Comment	Issue	Draft USACE Response	
10-8	Pipelines are inherently not water dependent, and the Applicant has not clearly demonstrated that the Project is an exception. The Applicant has also failed to demonstrate that practicable alternatives do not exist.	Water Dependent/ Practicable Alternatives	The basic purpose of the Project as defined in the app abundant, reliable, and domestic supply of crude oil f Louisiana to various crude oil terminals located near water dependency is a project that "require[s] access question to fulfill its basic purpose." Because of the terminals in the Louisiana Coastal Zone, the route wi wetlands to meet the purpose of the Project. The proj applicable regulations.	
			A detailed alternative analysis was conducted for the practicable alternative that would still meet the purpo of the U.S. does not exist.	
10-9	Instead of avoiding wetlands and waters, the Applicant has avoided completing their application via a proper alternative analysis, to determine if non-wet potential project sites exist, or alternative methods. The alternative analysis must include direct, indirect, secondary, and cumulative impacts that take into account aspects of water quality, wildlife, and flood protection. Presently, the public has not received any information as to why the Project must be sited in the Applicant's preferred location.	Alternative Analysis	In accordance with 40 CFR 230.10(a)(2), BBP condu- alternatives. Of these, the Proposed Route was detern feasible, and cost-effective alternative. The other rou 230.10(a)(2), which defines practical alternatives as a after taking into consideration cost, existing technolo	
10-10	If the project is in the national security interest, it should be sited outside of floodplains that put the project and the product at risk.	Floodplains	In order to fulfill the Project purpose, approximately central Louisiana. Simply due to the geography of m coastal marshes, and floodplains, it is not practicable uplands and out of the floodplains. However, BBP has floodplains to the greatest extent practicable. All terr construction contours and allowed to revegetate. Abo constructed in accordance with all applicable federal, impacts to floodplain elevations and velocities.	
10-11	Impacts to wetland areas could obviously be minimized if the development were relocated to non-wet regions, or if the pipeline used HDD methods (Fig 1). As noted above, a burden to show the non-existence of practicable alternatives rests with the Applicant, when the proposed project is located in a special aquatic habitat and is not water-dependent.	Practicable Alternatives	Due to the geography of southern Louisiana, it is not St. James and avoid all impacts to waters of the U.S.; 40 CFR 230.10. BBP will utilize 32 horizontal direct U.S. However, it is not practicable to utilize HDDs to route due to engineering constraints associated HDDs BBP also conducted an alternative analysis (Attachm CFR 230.10(a)(2). Of these, the Proposed Route was technically feasible, and cost-effective alternative. For completely avoid impacts to waters of the U.S.	
10-13	By avoiding the Calcasieu river floodplain, the applicant could avoid 16 of ~63 acres of wetland destroyed in the parish. Only nine of eighty-seven of all stream crossings in Calcasieu Parish are avoided by HDD. The applicant could avoid many open cuts merely by drilling deeperunderneath the wetlands and waters of the United States.	Impacts in Calcasieu Parish	BBP has avoided and minimized impacts to waters of HDDs will be utilized to minimize impacts on waters the proposed construction footprint from 100 feet to 7 U.S. will be destroyed as a result of construction or o and waterbodies will be returned to pre-construction of U.S. Further, in accordance with 33 CFR 332.3 and a BBP proposes to purchase mitigation credits from US temporal impacts to waters of the U.S.	

blication Cover Letter, Page 3 is "to move an economical, from Clifton Ridge Marine Terminal in Lake Charles, St. James, Louisiana." Draft Responses to Comments Received during Second Public Comment Period (January 12, 2017 – January 31, 2017			
Commenter / Comment ID	Comment	Issue	Draft USACE Response
10-14	We request an alternatives analysis that includes horizontal drilling underneath major floodplain areas and major rivers as a result of this letter.	Practicable Alternatives	In accordance with 40 CFR 230.10(a)(2), BBP condu alternatives. Of these, the Proposed Route was detern feasible, and cost-effective alternative. BBP will utili proposed route. However, the utilization of HDDs un crossed by the Project is not feasible due to the engine on the maximum length of an HDD). Therefore, BBF in Attachment 9. Note that even if back to back HDD vegetation would still be required in most instances in location to the next. Clearing of vegetation would ha the geotechnical analysis required to properly design to avoiding impacts as inadvertent releases of drilling
10-15	Given the information available in public documents, it does not appear that LDNR or the Applicant have fully weighed the costs and benefits relevant to the Project. Direct, indirect, secondary, and cumulative impacts of the proposed wetland fill and clearing remain overlooked.	Costs and Benefits/ Impacts	As outlined in Attachment 9, BBP conducted an alter sound, technically feasible, and cost-effective route, a analysis for the portion of the Project located within t not result in the permanent fill of any wetlands. Furth will be mitigated utilizing USACE approved mitigated
10-16	Given that the Public Notice does not thoroughly adhere to the executive order, the Corps and LDEQ and LDNR should deny the permit application.	Adhere to Executive Order	As required, the public notice adheres to the requirem order are addressed in the application and by the offic
10-17	The cumulative impacts on storm and flood protection must also be taken into consideration. This project could incite additional construction and in turn jeopardize even more wetlands unique to this area. This activity, combined with similar wetland- destroying projects, could result in more flooding in nearby communities, as well as degraded water quality in the Calcasieu River, Bayou Lacassine, Mermentau River, Bayou Queue de Tort, Granges Coulee and Vermillion River, The Indian Bayou Floodplain, Bayou Tortue and Bayou Teche, the entire Atchafalaya Basin, Lower Grand River, Bayou Lafourche, and Bayou Verret, and other surrounding wetlands that depend on these rivers. The whole area must be looked at as an interrelated ecological unit in order to adequately assess the true cumulative impacts.	Cumulative impacts	It is purely speculative to assume that the Project wou wetlands. The project has no interconnects proposed one set of terminals to another to offer safe and effect not result in impacts to wetland habitats that would re disturbed Project areas to pre-construction contours to impacted wetlands will be allowed to revegetate nature vegetation maintenance will occur through the life of BBP will purchase mitigation credits to offset unavoi CFR 332. Should other projects be constructed in the also required for all unavoidable impacts to waters of loss of waters of the U.S.
10-18	Since the Public Notice does not assess, or even recognize, the potential direct, indirect, and cumulative impacts that will result from the direct destruction of over 600 acres of wetlands, The Corps and LDEQ and LDNR cannot approve this proposal as submitted.	Public Notice	The public notice adheres to the requirements of 33 C proposed to be destroyed as there is no proposed fill c waters of the U.S. as a result of the Project.
10-19	The Applicant must develop disaster-response plans, and local floodplain officials should be included in the notification of this permit since the proposed site sits within an area vulnerable to flooding.	Disaster-Response Plans	In accordance with 49 CFR 194, BBP is preparing a f response and will submit it to PHMSA prior to comm officials have been coordinated with as appropriate.
10-20	The materials in the pipeline are not specifiedthe proposal is for both "light" and "heavy" crude oil. But there is a great difference in response and impact for oil sands spills than for light, Bakken crude. LDNR and LDEQ cannot evaluate a spill response plan when the material transported is not even specified.	Spill Response Plan	The pipeline is being designed to transport both light the applicable requirements of the Oil Pollution Act of National Oil and Hazardous Substances Pollution Con Southeast Texas and Southwest Louisiana Area Conti Contingency Plan. The FRP will address measures sp transported via the pipeline.
10-21	Until the Applicant has drafted an adequate spill-response plan, its application for a WQC and CUP ought to be deemed inadequate.	Spill Response Plan	BBP is preparing a facility response plan (FRP) to ad PHMSA prior to commencing the transportation of cr development, but cannot be finalized until construction final design and construction of the system.

Draft Responses to Comments Received during Second Public Comment Period (January 12, 2017 – January 31, 2017)			
Commenter / Comment ID	Comment	Issue	Draft USACE Response
11-4	With respect to alternatives, Bayou Bridge merely represented, without support, that pipelines were safer than rail or truck transport of oil and that this route was better than others through the Atchafalaya Basin because it uses an existing right of way. It did not produce any evidence to meet its burden to show no non-wetland alternatives existed for its project. In other words, it did not support why the pipeline has to go through the Atchafalaya Basin (or any other wetland) in the first place. Likewise, it provided no explanation of what it meant by "safer." And it provided zero information on mitigation; it merely stated that it would use a mitigation bank.	Public Hearing/ Practicable Alternatives/ Mitigation	In accordance with 40 CFR 230.10(a)(2), BBP conduct alternatives. Of these, the Proposed Route was deterr feasible, and cost-effective alternative. Because of the terminals in the Louisiana Coastal Zone, the route will wetlands to meet the purpose of the Project. As detain still meet the purpose and need of the project and wou Public records undisputedly support the fact that pipe gas. According to the U.S. Department of Transporta Administration (PHMSA), "The nation's more than 2 cubic feet of natural gas and hundreds of billions of to are essential: the volumes of energy products they mo transportation. It would take a constant line of tanker every two minutes, 24 hours a day, seven days a week railroad-equivalent of this single pipeline would be a systems are the safest means to move these products" In accordance with 33 CFR 332.3, BBP proposes to p mitigation banks to offset unavoidable impacts to wat credits to be purchased is provided in both the applica mitigation plan.
11-5	The Corps must provide a new public notice and comment period once it obtains all of this information from Bayou Bridge to allow the public to comment.	Public Notice	BBP's application includes all information necessary review, and the public notice contained all information
11-6	The complexity of the information Bayou Bridge provided in this supplemental application renders the few days' notice even more inadequate. Additionally, despite including an LRAM application, the material still does not say where Bayou Bridge's mitigation will be, which is an essential aspect to allowing for meaningful comment. Further, because Bayou Bridge substantially amended its application, which was also designated as a Corps application, it requires a new Corps and DEQ public notice.	Insufficient Notice for Public Comments	The supplemental application did not differ significan additional information collected in the field since the impact calculations, which decreased overall impacts result of workspace modifications. Both the July 29, LRAM calculations and outlined the number of credit both filings state that BBP will purchase in-basin/in-k natural progression that would be followed if there we draft compensatory mitigation plan that was submitted description of the number and type of credits to be pu
11-7	The Corps must conduct an environmental impact statement on Bayou Bridge's application before deciding whether to grant a permit.	EIS	In accordance with NEPA, if after completing the review interest review, the USACE determines that the Project EIS could be prepared. However, the documentation significant impact; therefore one has not been prepare expertise with respect to the environmental impacts of with or concluded no respective significant impact, are satisfaction of the regulating agencies prior to BBP be
11-8	Here, the Corps must consider the loss of wetlands this project will cause as well as any other indirect impacts in light of the effects of all the other pipelines and projects the Corps has permitted in this sensitive ecosystem. In particular, the Corps must consider the addition of yet another spoil bank to a Basin with numerous out-of-compliance spoil banks, and it must consider the fact that the Bayou Bridge pipeline will go in an area that already has an out-of-compliance spoil bank.	Wetland Impacts / Spoil Bank	There is no net loss of waters of the U.S. as a result of U.S. will be allowed to revegetate naturally, and BBP impacts to waters of the U.S. Furthermore, the propo- as all excavated materials will be replaced in the trend contours. Some existing infrastructure BBP parallels Section 404 permitting, thus they are not out of comp

Draft Responses to Comments Received during Second Public Comment Period (January 12, 2017 – January 31, 2017			
Commenter / Comment ID	Comment	Issue	Draft USACE Response
11-9	The Corps must factor in its long-standing failure to enforce Section 404 permit conditions and its inability to do so because of resource constraints when it assesses the significance of the impacts of this project and the efficacy of permit conditions to reduce those impacts to minimal. In fact, the Corps' failure and inability to enforce permit conditions and other Clean Water Act violations can only be thoroughly assessed in an EIS, and stands as an independent reason why the Corps must complete an EIS for this application.	Section 404 Permit Enforcement / EIS	The New Orleans District of the USACE has adequat accordance with NEPA, if after completing the review review, the USACE determines that the Project would could be prepared. However, the documentation pro- significant impact; therefore, one has not been prepar special expertise with respect to the environmental in concurred with or concluded no respective significant the satisfaction of the regulating agencies prior to BB
11-10	When deciding whether mitigation will compensate for any adverse environmental impacts of the project which, unmitigated, would be significant, the Corps must assess the feasibility of success of the mitigation, the extent to which the mitigation will compensate for the particular values lost, and the connection between the particular mitigation which is implemented and the lost values. For the Corps to effectively do this, it must conduct an audit of the mitigation measures it has imposed to date, particularly those which purport to compensate for lost Atchafalaya Basin values. Without such an analysis, any conclusion the Corps draws about likely success of Bayou Bridge's proposed mitigation will be arbitrary and capricious.	Mitigation	In accordance with 33 CFR 332.3, BBP proposes to p mitigation banks to offset unavoidable impacts to wa formal vetting process as outlined in 33 CFR 332.8 b involves an Interagency Review Team as well as a pu By approving a bank's mitigation banking instrument mitigation bank is appropriately sized to ensure that t compensate for adverse environmental impacts acros
11-11	The Corps cannot rely on the LRAM because the Corps never promulgated it as a final decision and never analyzed its effectiveness and its impacts.	LRAM	The USACE, New Orleans District Regulatory Brand Rapid Assessment Method (LRAM) for use in calcul wetland impacts associated with activities permitted of the Rivers and Harbors Act of 1899 via a Special I 2017, the USACE issued another Special Public Noti updates, corrections, or clarifications to the LRAM. of any comments received during the public notice.
11-12	Further, because of the absence of any Corps explanation of how the LRAM works and how it compensates for wetland impacts, in connection with the Bayou Bridge public notice or the Corps' LRAM public notice process, it is essentially impossible for the public to evaluate any LRAM proposal.	LRAM	The USACE has provided a guidebook on the Regula that describes the LRAM process.
11-13	Bayou Bridge's proposed mitigation, developed according to the LRAM, does not render the effects of its project on the Atchafalaya Basin insignificant. Instead, it attempts to replace wetland values unique to the Atchafalaya Basin with dissimilar wetlands in wetland mitigation banks that do not share the unique values of the Basin	Mitigation	As outlined in the permit application and the draft co- impacts within the Atchafalaya Basin will be mitigate mitigation bank located within the same basin.
11-14	Bayou Bridge's proposed mitigation recently made available by the DNR reflects that it plans to mitigate only 64% of impacts via in-kind/in-basin credits. Thus, 36% of the mitigation will not be in the Basin and will necessarily fail to mitigate the loss of unique Basin attributes.	Mitigation	As outlined in the permit application and the draft co impacts within the Atchafalaya Basin will be mitigate mitigation bank located within the same basin. There Basin. While only 64% of the impacts could be mitig Project, this does not mean 36% is out-of-basin as the
11-15	Worse yet, even the 64% of impacts being mitigated "in kind" is not properly characterized. Bayou Bridge represents that 100% of the impacts of its project are "temporary," and the Corps' public notice essentially repeats that error (stating that only .03 acres will be "lost"). Bayou Bridge therefore conducted its LRAM calculations under the assumption that all impacts are temporary. To suggest that a project which will install a 162-mile long pipeline in invaluable wetlands in the Atchafalaya Basin will not result in any permanent loss of any wetlands is, on its face, absurd. The Corps and Bayou Bridge must support this conclusion.	Mitigation	As outlined in the application Cover Letter, there wil Project. All wetlands impacted will be returned to pr placed within wetlands. BBP classified all impacts a LRAM guidance document.

te means for enforcement of permits issued, and in w under Section 404(b)(1) guidelines and public interest d result in significant environmental impacts, an EIS vided thus far does not support a determination of red. 13-5	The Corps of Engineers and Louisiana Department of Environmental Quality should examine whether Bayou Bridge Pipeline, LLC can be made accountable for any future liabilities related to this pipeline, such as oil spills, damages to wetlands and/or any other out of compliance issues. A limited liability company (LLC) is a corporate structure whereby the members of the company cannot be held personally liable for the company's debts or liabilities. The applicant should disclose how risks will be borne and who will be responsible for remediation of the affected areas.	Safety / Accountability	BBP is a Limited Liability Company ("LLC") which available to businesses operating in the United States. protect "individual members" or "partners" from pers developed to encourage business owners to invest in t protecting them as individuals from certain financial I a company, but to limit the liability to its individual n very common and is widely utilized in businesses of a where individual members own the asset and where p like any company doing business under its normal con the company itself. Therefore, under a scenario when release or spill, the company, although a LLC, is not fi company is held liable under several Federal statues a 90"), National Resource Damage Assessment ("NRD (and interrelated references under the CWA and NRD release or spill resides with the company or persons re was BBP, then BBP would be held responsible for the Additionally, under OPA 90, the liability under that A structure or parent such that a LLC at an affiliate or su accountability for a spill or release and in fact are dire company or LLC is accountable for any spill, release OPA 90, it identifies and defines the lines of liability, the mechanism for which the Federal Government can release, the extent in which the company and governm mitigate/remediate and how the response efforts woul environment. In addition to the general nature of the Federal laws th releases, companies such as BBP carry insurance whi with spills and releases and environmental remediatio under OPA 90 but are often much more substantial th company or insurance carrier cannot cover the costs of government would then trigger the Oil Spill Liability billion value limit to cover the costs for clean-up and recover any dollars spent from the company or party of leveed on the transportation or importation of crude o staff, and replenishment of the Fund in the event the f
Louisiana Envir	conmental Action Network (LEAN)		
14-1	As the pipeline is buried below ground as a result of trenching and horizontal directional drilling operations under the water bodies and the materials stockpiles along the pipeline route, the contaminated soils and sediments associated with each watershed will be disrupted, tracked into surrounding areas and contaminate storm water and shallow ground water resources. The contaminated storm/ground water will be allowed to be discharged unregulated along the right-of- way and into the surrounding environment and distribute contaminants into the surrounding area outside of the pipeline corridor and right-of-way and contaminate other water bodies.	Contamination	The proposed construction methods proposed include minimize impacts relative to stormwater discharges. watershed, impacts from the project to the basin's ove will implement measures outlined in the project-speci should any contaminated soils or groundwater be enco or minimize impacts to the surrounding areas. All con be disposed of in accordance with federal, state, and 1

is one of the most common corporate formation types By definition, this corporate structure is utilized to sonal liability associated with the company and was the U.S. economy via the formation of companies while liabilities. The intent of a LLC is not to avoid liability to nembers on a personal level. This corporate structure is all types such as agricultural operations, other business rotection to the individual is necessary. However, just urse, the liability for actions of a company resides with re a pipeline (and assuming the reference is to BBP) has a free from liability or responsibility, but rather the and in particular the Oil Pollution Act (often called "OPA A") and the Clean Water Act ("CWA"). Under OPA 90 DA), the responsibility to remediate and quantify/qualify a esponsible for the spill and in the case or example if it cleanup and remediation and any costs that may arise. Act assigns liability to the highest level of corporate ubsidiary level is not immune to responsibility or ectly accountable. Same is true if there is no parent, the and any associated remediation or mitigation. Under limits of certain liability for certain causes of spills and n take to assign the liability, how to remediate a spill or nent would respond to a spill or release, the costs to ld be directed to insure minimization of impacts to the

hat govern and protect the public from spills and/or ich provide insurance coverage for liabilities associated on/mitigation. These policies are also partially regulated han the minimums required by statue. In the event that a of a spill remediation or mitigation, the Federal Trust Fund ("the Fund") under OPA 90, which has a \$1 claims for which the Government would deploy but then responsible for the spill. Money from a fee (\$.09/barrel) oil is used to fund and maintain the response equipment, funds are deployed in response to a spill.

e the use of best management practices to avoid and Since the project is a narrow corridor within a large erall water quality would not be noticeably affected. BBP ific Unanticipated Discoveries Plan (Attachment 8) ountered during construction. These measures will avoid intaminated media encountered during construction would local regulations.

14-2	By DEQ granting this water quality certification, it would indicate a lack of need to monitor water that is discharged during the pipeline construction process. Based on the contaminants associated with each watershed, DEQ should deny the water quality certification and prohibit the discharge of contaminated storm water and shallow ground water containing contaminated soil and sediment particles into the environment. As an alternative, DEQ should be required to establish discharge monitoring requirements for the contaminants in each water shed and require treatment of the water to remove the contaminants before allowing the water to be discharged into the environment along the pipeline corridor.	Contamination	By in large impacts from construction of a pipeline as slightly downstream. By nature of the proposed cons proposed, affects to the soils and shallow groundwate conditions included in the Section 401 water quality in the project-specific Unanticipated Discoveries Plan groundwater be encountered during construction. Th areas. All contaminated media encountered during con- federal, state, and local regulations.	
14-3	The Louisiana Department of Environmental Quality must comply with Federal Civil Rights Regulations. These regulations require DEQ to avoid the adverse impacts of the proposed pipeline terminus on the Environmental Justice community living along Burton Street. The pipeline project would disproportionally effect the EJ community on and around Burton Street.	Environmental Justice	The jurisdiction of the DEQ is limited to areas of juri does not contain waters of the U.S. and therefore is n including EJ does not apply to that area. Furthermore the terminus of the project, which is a predefined loca need of the Project.	
Sierra Club, De	Ita Chapter – Baton Rouge Group			
15-1	We also believe that the Corps of Engineers, the LDEQ, and the applicant failed to present the possible Cumulative Impacts and full scope of this project. As a result, we believe that the concerned people were unable to understand the full impacts of this project. What was presented was a pipeline which will cross part of Louisiana which is in the area of the country under the jurisdiction of the New Orleans District of the U.S. Army Corps of Engineers.	Complete Application	BBP's application includes all information necessary review.	
15-2	The U.S. Army Corps of Engineers has, we believe, failed to comply with federal laws and regulations by breaking down, or allowing the applicant Bayou Bridge Pipeline, to break down or disconnect the various parts of this massive proposed oil pipeline project from North Dakota to south Louisiana by Districts of the Corps of Engineers so that the real comprehensive picture of this entire project cannot be understood and commented on by interested persons.	Connectivity	There is no component of the proposed BBP outside transportation project; Phase 1 commenced in Nederl and began operations the second quarter of 2016. We permitted and built other projects; BBP is not connec existing regulations, each crossing of a water of the U for an Individual Permit under the Clean Water Act is	
15-3	The applicant, the LDEQ and the Corps officials at the hearing did not explain where the oil will be coming from and where it will be going.	Source / Destination of Oil	As described in the application Cover Letter (Pages 3 terminal in Lake Charles to a terminal in St. James th will be refined into products to meet consumers' need further processing, for crude oil derivative products (crude to be transported via the proposed pipeline it m however, the location of origin is not a factor.	
15-4	The officials at the Department of Environmental Quality, we believe, have a responsibility as the lead state agency on the environment to do more than just certify that the work on the proposed pipeline will not adversely impact water quality during the construction of the pipeline. Many of the speakers during the public hearing in Baton Rouge spoke about problems caused by previous pipeline projects in the Atchafalaya River Basin, which obstruct water flows in the Atchafalaya Floodway and Atchafalaya River Basin. These levees caused by miles of dirt stacked up along pipelines have definitely adversely impacted water flows, water quality and the habitats for wildlife and aquatic species like crawfish. These adverse impacts are felt throughout the Atchafalaya River Basin and not just in the pipeline right of ways.	Existing Conditions in the Basin	The state is also reviewing the project for consistency Department of Natural Resources, Office of Coastal I Corps of Engineers the lead agency. Previous pipelin be constructed such that it does not violate any federa to be utilized are designed to minimize impacts to aquand navigational, commercial, and recreational activi pre-construction contours to minimize impacts to the unavoidable impacts to forested wetlands and there is	

re localized to the area directly affected and sometimes struction methods and best management practices er are anticipated to be negligible. BBP will adhere to all certification. BBP will also implement measures outlined n (Attachment 8) should any contaminated surface or nese measures will minimize impacts to the surrounding onstruction would be disposed of in accordance with

sdiction under the USACE, as such the area mentioned ot jurisdictional; DEQ's evaluation of any component, , the referenced community is located over 1 mile from ation (the existing terminal) based on the purpose and

15-5	We believe that officials associated with the applicant, Bayou Bridge, the U.S. Army Corps of Engineers, and the Louisiana Department of Environmental Quality have failed to adhere to Article 9, Section 1 of the Louisiana Constitution of 1974, which states, "The natural resources of the state, including air and water, and the healthful, scenic, historic, and esthetic quality of the environment shall be protected, conserved, and replenished insofar as possible and consistent with the health, safety, and welfare of the people. The legislature shall enact laws to implement this policy."	Compliance	The regulations providing for the state permitting pro state constitution. Therefore, the appropriate agencies applicable regulations complies with the constitution.	
15-6	We see little information in the application by Bayou Bridge Pipeline that alternative sites, projects and processes were considered by the applicant for this project.	Alternatives	In accordance with 40 CFR 230.10(a)(2), BBP condu alternatives. Of these, the Proposed Route was detern feasible, and cost-effective alternative. The other rou 230.10(a)(2), which defines practical alternatives as a after taking into consideration cost, existing technolo	
15-7	Numerous spoil banks are testimony to the damage created by the installation of previous pipelines. These levees have altered the water flow, causing a negative effect on the aquatic species that inhabit that part of the Basin. The applicant, Bayou Bridge Pipeline has failed to address how it will avoid this problem.	Spoil Banks	BBP will avoid preventing the flow of water by restor conditions as presented in the application.	
15-8	Bayou Bridge officials have failed to provide adequate information about how their pipelines will be protected from the introductions of other materials into the oil being transported like hazardous waste.	Product / Hazardous waste	The pipeline is designed to carry a range of crude oil which the system is designed and operated for will no
